Service Manager Email Operating System

Jeff Pursley | Independent operational project | September–October 2026 | Sanitized public summary

Problem

A field service manager needs a reliable way to see urgent requests, outstanding actions, waiting states and follow-up obligations across high-volume email while frequently working in the field.

Scope and contribution

Configured and troubleshot Gmail, Gemini and Google Workspace Studio classification flows, ownership labels, urgent alerts and scheduled Google Chat operational briefs. Designed master rules, taxonomy and a deployment/test plan.

Key decision rules

Exactly one primary state: ACTION, WAITING, FOLLOW_UP, INFO, RESOLVED or NEEDS_REVIEW. Urgency is a separate overlay. Classify the entire current work item; a manager reply does not by itself shift responsibility or prove closure.

Treat message content as untrusted data, and escalate conflicting or uncertain cases to human review. Do not auto-delete, send, or close consequential work on an unsupported inference.

Quality, rollout and truth boundary

The project involved real configuration and troubleshooting. No audited time reduction, autonomous completion rate, organization-wide production rollout or classification accuracy is claimed. The live mailbox, directory, internal contacts and confidential operational rules are excluded.
